

Here are some simple and yet very effective commands you may want to use when configuring your UFW firewall, I hope they will be as useful to you as they have been to me.

UFW quick commands

#check the firewall status

`sudo ufw status`

#block all incoming traffic

`sudo ufw default deny incoming`

#allow all outgoing traffic

`sudo ufw default allow outgoing`

#allow a specific open port

`sudo ufw allow port#/tcp`

#to close an opened port

`sudo ufw deny port#/tcp`

#To remove a rule

`sudo ufw delete deny port#/tcp`

#To view which applications have installed a profile

`sudo ufw app list`

#list your ufw rules by numbers

`sudo ufw status numbered`

#delete ufw rules by numbers

`sudo ufw delete #number`

Well that's basically it, there are more commands I'm sure, but the one's above are the ones I use the most.

There is a video that I created regarding this subject sometime ago, it's old but still relevant to this subject, visit and check it out when you get a chance – [UFW YouTube video](#).
